Quote: No such file or directory ... eht0 doesn't auto-connect, and although it is easy to manually connect, I need it to auto-connect. Puli uses Barry's Simple Network Setup for automatic network connection. If the automatic config fails and you need to invoke SNS, the folder contains at least one human readable "connections" file like this: Code: eth0|Wired|tg3|pci|Broadcom Tigon3 ethernet driver |<some hexadecimal values here>|| Next time the same settings is used for auto-connection. Except if you are using another connection manager software... in which case you need to amend the Default.smartsave file accordingly. Quote: The sound is muted despite "Retrovol/Main/Auto-mute being unticked, Instead, please right-click the Retrovol tray icon, then in the Settings tab of the popup window, ensure that the slider is bound to the master volume control. Once you have sound, this will be saved for the next session. Quote: When I 1st run "Menu->Internet->Web browser", only a single default Google Chrome window appears. If I then close that and repeat, my 3 web page tabs open in a single window/page. Is it possible to have those open as 3 separate windows? For security reasons, only a single Chrome window is allowed in Puli with as many tabs as needed. To enable multiple Chrome windows, you can play with the killal commands at the beginning of the /usr/local/bin/defaultbrowser file There is no such restriction for other browsers, e.g., Opera. Have fun! regards, gjuhasz Profile Market PM **Back to top** Sylvander Posted: Mon 20 Jul 2015, 03:59 Post subject: Joined: 15 Dec 2008 Posts: 4439 1. "Puli does not deal with any pulisave.?fs (.2fs, 4fs, etc) file either at boot time or at shutdown. I am wondering if you wrote some code or installed incompatible software. Location: West Lothian, (Edit: I see in your previous post that you "installed pupsaveconfig, and used that to make a new pulisave".) " Scotland, UK a. To eliminate such a possible cause of the problem, I used a 2nd Puppy to delete: pulisave.4fs Both of the backups I'd made that were located in the /sdb1/backups folder. b. Then I booted into Puli. c. Once there it was necessary to make the basic setup configurations [language etc]. d. I then rebooted, and during that chose to "smartsave", which appeared to go well. e. Once back to the desktop, it was necessary to complete basic setup yet again. I could do this repeatedly [I did] and the settings were NEVER auto applied. SOMETHING IS AMISS. F. Do you think I need to go waaay back to the beginning, by re-doing "Copy Puli to the pendrive"? Here's mine...

Posted: Tue 21 Jul 2015, 07:36 Post subject:

Code:

I cannot find any timezone file.

3 Folders: etc, root, usr.

1 File: 1-rigorous.

Aught I to do this?

1 File = smartload.

Profile B PM

Dear Sylvander,

1. "syslinux.cfg file with the following content:"

2. "timezone file with the following content:"

Perhaps I'll find one once I've booted into Puli.

Do you think mine has been populated?

This is all strange and new to me.

This is beyond my comprehension.

3 Folders = root, smartsave, usr.

8. "...with your favorite smartload file)"

I don't understand why you say this is my "favorite".

2) ... I cannot find any timezone file.

ad 1.) I assume that your syslinux.cfg file should be like

a. My mnt/sdb1/patch folder is not empty; it holds:

4. "the smart save scripts will populate it with session data"

Where, for example, would be a good "less temporary" place?

My /mnt/sdb1/profiles/Common subfolder holds the following:

So far as I know this [and its content] was not chosen by me.

I'm working from Slacko-5.7.0, and looking at stuff on the Flash Drive to which Puli is installed:

default vmlinuz initrd=initrd.gz pmedia=usbflash pfix=ram

I understand: "I changed the default scripts behind my "mild", "rigorous", etc. icons"...

7. "Profiles folder (I know that you already have a Common subfolder here..."

But not: "...that restores the last saved "mild", "rigorous", etc. content of my patch folder.".

I don't know enough to know what to type, and some of those files don't even exist at this time.

1) ...default vmlinuz initrd=initrd.gz pmedia=usbflash pfix=ram

(I don't see Glasgow or Edinburgh listed in /usr/share/zoneinfo/Europe 📛)

Next time, you get your defaults again, even if you selected "Save: smart" previously.

ad 7.) It is the default content after installing Puli. But later you may add other items here.

Last edited by gjuhasz on Tue 21 Jul 2015, 20:17; edited 5 times in total

1. "1) I assume that your syslinux.cfg file should be like"

default vmlinuz initrd=initrd.gz pmedia=usbflash pfix=ram pkeys=uk plang=en_GB

Europe/Budapest in timezone remain active each case (those fields are filled up with this values when Quicksetup pops up).

It depends... In Puli, the Quicksetuip dialog welcomes you each case, waiting for confirmation or for session-level changes.

ad 4.) Please check the Default.smartsave file. When activated, it saves your network, audio, etc. settings in the patch folder.

ad 3.) You are right, the patch folder can contain different files and sub-folders when selecting different profiles.

default vmlinuz initrd=initrd.gz pmedia=usbflash pfix=ram pkeys=uk plang=en GB

3. "In Puli, the Quicksetuip dialog welcomes you each case, waiting for confirmation or for session-level changes."

Keyboard numlock is the default settings, regardless of what you tick in QuickSetup.

This should be considered a bug if QuickSetup does not manage this as the user selects.

1. "Keyboard numlock is the default settings, regardless of what you tick in QuickSetup."

Since I want to have Numlock ON in this specific machine, I should leave this file as-is, right?

And is this "backup" auto-applied [restored?] at the start of each session on this particular hardware?

And even if I don't tick the box to OK that, it is still ON? That is counter-intuitive.

I don't understand how this file existing in this location constitutes a BACKUP.

5. "Note that the firewall is auto ON, too, even if its box remains unticked."

6. "In Puli, the QuickSetup dialog welcomes you each case."

OK, I understand, but would have preferred if you'd worded it as:

Your wording is more succinct than mine, but slightly "unusual".

Do you think it is as suitable as a multi-session DVD-RW?

Should I hold off doing this until I have all the Puli basics under control?

I'll go back to the 1st post of this thread to try to find some info on that.

So once agin I went to "volume->Full Window->Master", and ticked it.

You might consider addressing this in the next release.

Thanks for your suggestion. I try to improve the "Puli flavor" of Quicksetup in the next release.

Is it possible to install a WINE? If so, how? PET or SFS? If PET, which PET?

I propose using www.smokey01.com/gjuhasz/packages/wine_puli_wt-1.7.21.pet if you need to run wine.

Please check whether the Default.smartsave file contains the sound saving section (see my post sent on 17 Jul).

why it is necessary to do this rather than this being done when I use the QuickSetup window

1. "I propose using www.smokey01.com/gjuhasz/sfs/wine_puli_wt-1.7.21.pet if you need to run wine. "

I cannot remember doing this, but I already have /mnt/sdb1/packages/wine_puli_wt-1.7.21.pet, so all is well.

3. "Please check whether the Default.smartsave file contains the sound saving section (see my post sent on 17 Jul)."

Small problem as follows: when I run it, it asks to have 2 components installed, which I do, and that is successful, but it takes TIME.

2. "I will send you an URL in a PM. Playing a video there generates an alarm: in Rigorous mode it will be auto-blocked in a few seconds."

I guess it isn't good to attempt to connect to the internet and sync the clock, whilst "the network isn't set up" [whatever that means].

... it asks to have 2 components installed, which I do, and that is successful, but it takes TIME. Is it possible to avoid this?

During bootup, Puli copies the content of /mnt/sdb1/profiles/Common/root/Startup to /root/Startup. This is why you see those files in /root/Startup, too.

6.0.3, you will see more flexible and easier-to-use configurations, for example, you will be able to select any of your pre-set boot configurations on-the-fly, during bootup.

This is the default behavior of the original wine package. I never install those (obsolete) components. They are (mostly) unnecessary. Note that my wine package has winetricks built-in.

6. "if you rename it (within the Startup folder) to zztimesync.sh, then it will find a just activated eth0 at the beginning, too."

a. "play the same video. In a few seconds, Puli barks and the network tray icon becomes red. After another few seconds, the video is interrupted."

b. "Try to play the same video again: you will not be able to play because it is blocked. Check the /etc/suspicious_hosts file which is referencing this host."

About Barry's bugfix: are you referencing to /etc/printcap where the old name still appears after renaming the machine?

Is it possible to [use a website perhaps, to] test that my choice of "1-rigorous" is functioning as it aught?

I will send you an URL in a PM. Playing a video there generates an alarm: in Rigorous mode it will be auto-blocked in a few seconds.

finishes. But if you rename it (within the Startup folder) to zztimesync.sh, then it will find a just activated eth0 at the beginning, too.

In Puli, the QuickSetup dialog is ALWAYS auto-displayed when you reach the desktop at the beginning of each new session.

Thank goodness the "Firewall enabled" box is ticked in my "QuickSetup" window.

I'd like to see ALL of my preferred choices already set to ON, so I only need click OK.

Does everyone reading understand the difference between precision and accuracy I wonder?

OK, was able to use WINE, and access my "Acerose Password Vaullt", and login to my online banking website.

3. Is it possible to [use a website perhaps, to] test that my choice of "1-rigorous" is functioning as it aught?

Does this warn when a possibly malicious connection has been attempted from outside to inside?

OK, it barks, but then, my sound is MUTED->[I need to un-mute it somehow], so I wouldn't hear that.

So "Keyboard numlock" is on, even though the tick-box is unticked in the QuickSetup window, right?

2. "If you don't need Numlock, please delete the numlockx file from /profiles/Common/root/Startup folder on the pendrive..."

" In Puli, the QuickSetup dialog is ALWAYS auto-displayed when you reach the desktop at the beginning of each new session."

3. "...or put an empty numlockx file (!) in the /root/Startup folder if you want to create a machine-specific backup."

QuickSetup window now displays these settings once I get to the desktop, and it's easy just to OK these.

a. This is the value I normally use. I made a /mnt/sdb1/timezone file with that code inside.

4. "Next time, you get your defaults again, even if you selected "Save: smart" previously."

This avoids the hassle of an un-necessary display of the QuickSetup dialog.

Note that the firewall is auto ON, too, even if its box remains unticked.

Correct. In Puli, the QuickSetup dialog welcomes you each case.

Last edited by gcmartin on Wed 22 Jul 2015, 03:34; edited 4 times in total

/root/Startup/numlockx already exists, and is empty...

I fail to mentally grasp the significance of such things.

Again...it seems counter-intuitive.

English is not your 1st language, right?

Posted: Wed 22 Jul 2015, 04:01 Post subject:

1. I fancy using Puli for online banking.

Might it be OK to run a WINE SFS file?

My WINE SFS has loaded and run OK.

And all with the Puli Flash Drive removed.

If so, how? PET or SFS? If PET, which PET?

OK, I've managed to un-mute the sound.

How should I make this un-mute permanent?

Profile De PM

Sorry for the late reply.

Learned something new.

What does it do?

I then clicked "Apply".

A good result methinks.

Code:

I don't know how to do that.

sh /usr/local/psync/timesync.sh"

Code:

"tabula rasa" = "blank slate", right?

But that is only by default.

Sounds GOOD.

Page 3 of 21 [303 Posts]

When will 6.0.3 be available?

#!/bin/sh

It has the following content:

sh /usr/local/psync/timesync.sh

Must it be this complex in Puli?

Something went wrong, I didn't receive a notification of your post.

1. " I never install those (obsolete) components. They are (mostly) unnecessary."

Tried canceling the installation of those 2 components, and the **winefile** command works just fine, so that's how I'll use it in future.

The volume icon then changed to muted, then moved position in the tray to leftmost, then became un-muted, with the volume at 1000%.

3. "...select Tray tab > ensure that the Tray slider is associated with the Master Playback control > click Apply..."

It would be nice to be able to CHOOSE during startup whether to use "blank slate" [like puppy pfix=ram] or NOT.

Normally, I'd want to use my personalizations by default, and "blank slate" by choice [as is the "normal" Puppy method].

Right now, I only understand how to drag a [/mnt/sdb1/Backups] backup onto the [/mnt/sdb1/Backups] "restore" icon...

Would it be possible to have the latest configuration arrangement put into effect by default, after a short [5 second?] timeout?

Thanks for bringing this to community attention! Maybe this fix can be added to WOOFCE for the next PUP builders to have.

About Barry's bugfix: are you referencing to /etc/printcap where the old name still appears after renaming the machine?

This needs reporting/resolution as every PUP with FirstRUN is missing this field's proper setting with obvious implications. Inconsistent system settings, is one.

Woa...if only I understood all of this, I might then be able to make use of it, and might think "what a wonderful way to do things".

7. "there are different opportunities (patch folder, Common folder, smartload, smartsave features, backups, etc.) to remember some user settings and/or data from any of the past sessions."

8. "In Puli 6.0.3, you will see more flexible and easier-to-use configurations, for example, you will be able to select any of your pre-set boot configurations on-the-fly, during bootup."

In the Tray tab...the "Tray Slider" drop-down-box item chosen = "25:Master Playback Volume".

4. "Please only run the /etc/asound.state script AFTER the above settings are successful."

5. "you can save a few bytes by creating a "/root/Startup/zztimesync" script that looks like this:

Tried using ROX to left-click on that, but doing so only opened the file as a text file.

Was it incorrect to leave the extra part in? [I know nothing of how Linux works]

6. "By default, Puli offers a fresh start for each session - "tabula rasa"."

And it's too troublesome to be forced to do that at [almost?] every session.

Deposted: Thu 30 Jul 2015, 13:16 Post subject: FirstRUN (Personalized Settings) bug/oversight

No one else has picked up on this oversight. One, I know, has ignored it.

We are all related ... Its time to show that we know this!

3 Different Puppy Search Engines or use DogPile

Is it possible to avoid this?

The above happened.

/etc/asound.state

/usr/local/psync /root/startup

procedure finishes."

What is "the network" exactly?
What is "the Restore procedure"?

Must it be this complex in Puli?

Profile De PM

And...

Or, use the Psync window to sync the time manually.

Last edited by gjuhasz on Mon 09 Nov 2015, 11:03; edited 1 time in total

I see it loading during Puli startup, and it runs using the **winefile** command.

In fact, I had to manually "Setup networking" once again to get re-connected to the web.

This worked, except it took about a minute to interrupt the video.

And the 'Master Playback Volume' [in both] is set to the "value 12".

I am guessing that this explains why my sound is presently un-muted.

The significance of this file existing in 3 locations is beyond my understanding.

Deposited: Mon 27 Jul 2015, 15:09 Post subject: It's all SO MUCH EASIER in a "normal" Puppy.

the 'Master Playback Volume' [in both] is set to the "value 12"

/usr/local/psync is the folder where this timesync.sh script can be found in each puplet.

appropriate). Please only run the /etc/asound.state script AFTER the above settings are successful.

The significance of this file existing in 3 locations is beyond my understanding.

I admit that you can save a few bytes by creating a "/root/Startup/zztimesync" script that looks like this:

I've read this again and again, and I have only the vaguest grasp of its meaning/significance.

I'd need WINE to be available.

I seem to be good to go.

I have 3 SFS files.

Profile S PM

I'm wondering if such stuff will look different once I boot into Puli, or once I make/save configuration changes.

3. "patch folder. I created it by clicking on the "mild" icon. In "milld" profile, this folder is empty by default"

5. "Re-clicking a profile icon purges the content of the patch folder, so the sooner, the better, its files should be copied to a "less temporary" place."

6. "I changed the default scripts behind my "mild", "rigorous", etc. icons that restores the last saved "mild", "rigorous", etc. content of my patch folder."

So you are saying I should not use the [nice and easy] welcome window [YIKES!], but instead type settings within the appropriate files?!

I am convinced that some Puli features require better explanation thus I decided to upload a demo video to Youtube soon. Together with announcing Puli 6.0.3 🖳

...So you are saying I should not use the [nice and easy] welcome window [YIKES!], but instead type settings within the appropriate files?!

2. "2) The default timezone (GMT) should be redefined by a separate timezone file (create it manually). I think your timezone file should contain a single line:"

c. With all of the above pre-set, even though it's something of a nuisance for QuickSetup to display at the beginning of EVERY session, at least all I'd need do is click OK to accept these.

b. A "normal" Puppy usually only does this when it detects that it has been booted on hardware that is different to the previous session, and therefore needs some values re-configured.

c. With all of the above pre-set, even though it's something of a nuisance for QuickSetup to display at the beginning of EVERY session, at least all I'd need do is click OK to accept these.

You might consider addressing this in the next release. Menu>Setup>Quicksetup-FirstRUN intends to allow the user proper desired settings, anytime it is used. If the system is not allowing it to do so, this is a bug.

What I don't understand, is why it is necessary to do this rather than this being done when I use the QuickSetup window [GUI], and the Psync window that results from ticking the "Set time/date from the internet" box.

I mean...you surely cannot have every-single-user being personally instructed as you are doing for me here...or alternatively, the user instructions are going to be VERY detailed and complicated.

b. All I need for all my preferred choices to be pre-set, is for "Keyboard numlock" and "Set time/date from the internet" to be pre-ticked also.

Shouldn't "Save: smart" reset the defaults to the newly configured values, and the QuickSetup dialog only display when the hardware has changed?

I suppose the present arrangement works well if/when the Flash drive is being moved around to different machines, in different timezones and languages, right?

All I need for all my preferred choices to be pre-set, is for "Keyboard numlock" and "Set time/date from the internet" to be pre-ticked also.

Concerning auto-syncing time with internet - please copy the /usr/local/psync/timesync.sh file to /profiles/Common/root/Startup folder on the pendrive.

Also, QuickSetup is NOT setting all Hostname fields when the user changes it to his preference. @BarryK fixed this bug in his last Quirky/April release.

a. I DO need numlock, and I DO have a /mnt/sdb1/profiles/Common/root/Startup/numlockx file that is empty, that I want to keep, so I will leave it as-is.

4. "Concerning auto-syncing time with internet - please copy the /usr/local/psync/timesync.sh file to /profiles/Common/root/Startup folder on the pendrive."

I have the characteristic [fault?], that wishing to be both PRECISE and accurate, I tend to be rather long-winded. [As are Lawyers with their wordings]

Also, QuickSetup is NOT setting all Hostname fields when the user changes it to his preference. @BarryK fixed this bug in his last Quirky/April release.

In Puli, the QuickSetup window tries to connect the Internet while the network isn't set up yet. With the timesync.sh file the Startup folder, there is a better chance that it is activated during the network connection is up. At least, it happens when the Restore procedure

5. "In Puli, the QuickSetup window tries to connect the Internet while the network isn't set up yet. With the timesync.sh file the Startup folder, there is a better chance that it is activated during the the network connection is up. At least, it happens when the Restore

Please right-click the Retrovol tray icon > the Retrovol config window pops up. Here, select Tray tab > ensure that the Tray slider is associated with the Master Playback control > click Apply (names in this sequence are hardware-specific - please interpret them as

Afrter you click OK in Quicksetup, the scripts in the /root/Startup folder are executed in **alphabetic order**. Among them, the zsupp script establishes the network connection. Consequently, a zztimesync or similar name script runs only after zsupp has finished, thus being

By default, Puli offers a fresh start for each session - "tabula rasa". However, there are different opportunities (patch folder, smartload, smartsave features, backups, etc.) to remember some user settings and/or data from any of the past sessions. In Puli

All these years of using FirstRUN with hostname facility setting, this field was overlooked and apparently untested. In the years as this FirstRUN field's handling was improved, the focus was on 4 system fields, thus, missing this field. FirstRUN, initially by @Shinobar became a central point to setting the fields properly. @BarryK took over and provided his improvements further handling this field in FirstRUN for the overall Puppy system. This intends to set the system, so that everywhere you look you would find a "consistent" hostname in Puppy

You are right, English is not my first language - thanks for the correction, I will use your words in the next version. But, by then, please forgive me that the QuickSetup dialog warmly welcomes you to Puli each case you log in...

9. "check the above settings first and change them appropriately (set your keyboard, language and timezone as you want only there - do not configure anything in the welcome window)"

ad 2.) Unless you need to reference to GMT, your default timezone should be defined in a separate timezone file (please create it manually). I think your timezone file should contain a single line:

ad 5. and 6.) Consider using the profile-specific sub-folder, e.g., /profiles/1-rigorous/ on your pendrive. In this case you don't need to change your default script behind your profile icon, e.g., "1-rigorous".

According to Puli concept, the defaults are set in separate files but they may be temporarily superseded via Quicksetup, e.g., when booting Puli on a different machine. The goal is getting ourselves independent from the environment.

I circulate my Puli pendrive among four machines. My default pkeys=hu in syslinux.conf fits to a couple of them but I supersede this in Quicksetup either to "de (Germany)" or to "us (USA)" while working on the rest. But, plang=hu_HU.UTF-8 in syslinux.conf and

ad 8.) I meant your decision about which packages should be smart-loaded at boot time. Note that in the upcoming Puli 6.0.3, you can define multiple smartload files then select your "favorite" one (or omit loading extra packages) by hitting a key while Puli boots. 🤤

Keyboard numlock is the default settings, regardless of what you tick in QuickSetup. If you don't need Numlockx file from /profiles/Common/root/Startup folder on the pendrive, or put an empty numlockx file (!) in the /root/Startup folder if you

Deposted: Sat 18 Jul 2015, 18:35 Post subject: Preserving data between sessions

Normally, at the end, a session consists of three groups of info:

1. The content of the pup_ro2. No need to save it because it loads next time by default

Although I've used the sutdown dialog to successfully make a pulisave.4fs ... Puli fails to find the pulisave.4fs file during startup.

course, you need to select Save: smart in the shutdown dialog to activate this feature, i.e., have those commands in the .smartsave files run.

(Edit: I see in your previous post that you "installed pupsaveconfig, and used that to make a new pulisave".)

I found the /mnt/sdb1/profiles/Common/smartsave/Default.smartsave file. Should that help me?

Definitely, Combining smartsave and smartload is the "Puli standard" way to preserve the important files between sessions.

Puli does not deal with any pulisave.?fs (.2fs, 4fs, etc) file either at boot time or at shutdown. I am wondering if you wrote some code or installed incompatible software.

2. The content of the packages installed. In Puli, there is no need to save them. Optimally they auto-load next time, too, providing that the smartload file remains the same.

Please keep in mind that if you restore a backup file then any misconfiguration there becomes active again. So, don't backup a session until you are sure that everything works well. Joined: 29 Sep 2008 Posts: 422 Quote: Once there it was necessary to make the basic setup configurations [language etc]... I then rebooted, and during that chose to "smartsave", which appeared to go well ... Once back to the desktop, it was necessary to complete basic setup yet again. I could do this repeatedly [I did] and the settings were NEVER auto applied. I have the following config items on my pendrive next to the puppy_puli_6.0.2.sfs file: 1. **syslinux.cfg** file with the following content: Code: default vmlinuz initrd=initrd.gz pmedia=usbflash pfix=ram pkeys=hu plang=hu HU.UTF-8 2. **timezone** file with the following content: Code: Europe/Budapest 3. patch folder. I created it by clicking on the "mild" icon. In "milld" profile, this folder is empty by default but the smart save scripts will populate it with session data. Warning! Re-clicking a profile icon purges the content of the patch folder, so the sooner, the better, its files should be copied to a "less temporary" place. I changed the default scripts behind my "mild", "rigorous", etc. icons that restores the last saved "mild", "rigorous", etc. content of my patch folder. 3. **Profiles** folder (I know that you already have a Common subfolder here with your favorite smartload file) Quote: Do you think I need to go waaay back to the beginning, by re-doing "Copy Puli to the pendrive"? Not yet. Please check the above settings first and change them appropriately (set your keyboard, language and timezone as you want only there - do not configure anything in the welcome window). I expect that from this point, your Puli happily remembers his master's settings. Have fun! Regards,
