	 attach a pendrive which has already been "made bootable" by unetbootin for some other distro delete everything except "Idlinux.sys" and "menu.c32" from the pendrive copy to pendrive the extracted zipfile contents from http://www.smokey01.com/gjuhasz/Puli-6.0.4_Oct2015/Puli_install.zip
	If your bios "boot device order" is configured to prioritize USB, when you restart the PC with the pendrive attached you'll boot into a Puli session.

As Sylvander mentioned, firefox gui is displaying hu localization. I haven't yet figured out how to change it to english. Quote: Quote:
	Problem is: the opening window [and some of the titles in the others]all in Hungarian methinks.
	Dear catsezmoo,
	It seems that, regardless of how the original was created, Firefox updates arrive only in localized version. I just created a new package in an en-US environment. Feel free to download from
	www.smokey01.com/gjuhasz/packages/firefox-en.pet
	For some reasons, only the smartloaded package can be started as spot user (from menu or by clicking on the browse desktop icon).
	For Hungarian users, www.smokey01.com/gjuhasz/packages/firefox-hu.pet is available, too.
	Have fun!
	Regards,

	To tell the truth, I don't know how Mozilla decides which language set is needed for download. For example, MS Outlook selects its grammar check database based on the (default) keyboard settings. My configuration showed "en-US" for location and "GB" for keyboard when I download v42 update of Firefox. Please check if you see significant problem there in the aspect of Brit. English (Only the menu items should be checked, and I assume that there is no difference between the 16 English flavors in this level.) Anyway, if the next versions arrive and Firefox offers (you) to apply them, you get your location-specific version each time.
	I am not sure that such mixed (analog headphone plus USB mic) is supported by Linux in general. Until I try to get an an USB mic, I try to provide you with some "blind support". Let me ask you to do the following in your system while your headphones and USB mic is plugged in:
	 In a terminal, issue modprobe usb-snd-audio Select Menu > Alsa Setup > ALSA sound Wizard > Click on Multiple cards button. Create a screenshot. In ALSA Sound Wizard, select the analog device (maybe Card 0, Device 0) as default, then set the Master volume (and Headphone volume) to maximum. Test your headphone by issuing aplay /usr/share/audio/2barks wav (in terminal) In ALSA Sound Wizard, select the analog device (maybe Card 2 or 3, Device 0) as default and set the Capture volume of your USB microphone. Test your mic using Menu > Multimedia > mhWaveEdit audio recorder/editor.
	If your audio settings are OK now, create a backup. If not, the please send me the screenshot you created above. Alternatively you can use the analog mic (the background noise will not be compensated, I know) with the help of Retrovol settings (Unplug the USB mic, plug in the analog one, right click the sound tray icon then select Full window / Config window and set the sliders appropriately.)
	Have fun!
	Regards,
	gjuhasz
