DPosted: Sat 28 Nov 2015, 19:00 Post subject: TeamViewer compatibility issue resolved

I played with teamviewer and wine and skype and found some incompatibilities.

- Incompatibility between different wine versions:  
The official TeamViewer package contains wine 1.6 modules that are incompatible with newer wine versions. I promise a fix or at least a workaround. So, I updated the wine version from 1.6 to 1.7.21 in my TeamViewer package. Downloadable from my storage site at <http://smokey01.com/gjuhasz/packages/teamviewer-10w17.pet> Now its wine version aligns with [http://smokey01.com/gjuhasz/packages/wine\\_puli\\_wdt-1.7.21.pet](http://smokey01.com/gjuhasz/packages/wine_puli_wdt-1.7.21.pet). Now you can use them together. I also created a "bare" TeamViewer package that does not work in standalone mode but co-operates the wine package without unnecessary duplicates installed. Will share it after a few days of testing.
- Incompatibility between different TeamViewer versions:  
There is a king size Chrome extension available, it is practically TeamViewer 1.8 and does not need wine. I ran a quick test but did not find voice connection feature there. Same for earlier TeamViewers. Some of them allow the connection with another version but cannot control the remote desktop. Others simply say that "Old Version, please update". Others are OK but no voice connection allowed or even crash when tried.
- Skype (in)compatibility:  
I learnt that Skype compatibility (better saying: pulseaudio capability) is available in Teamviewer 1.7.55 and later versions only. I think I can have a fix for this in a few days.

Have fun!  
Regards,  
gjuhasz

DPosted: Mon 30 Nov 2015, 19:06 Post subject: TeamViewer 11 - wine 1.7.21

I got a PM from a friend.

**Quote:**  
I'd appreciate anyone with wine installed (other than version 1.6) to test if this does indeed solve the conflict problem.

Here you are...  
<http://smokey01.com/gjuhasz/packages/teamviewer-11w17.pet>

This TeamViewer includes wine 1.7.21 modules.  
(The wine\_puli\_wdt-1.7.21.pet is in the same folder: <http://www.smokey01.com/gjuhasz/packages/>)

Have fun!  
Regards,  
gjuhasz

**gjuhasz**  
DPosted: Tue 01 Dec 2015, 12:30 Post subject: TeamViewer 11 bare

Another package does not contain Wine at all.

<http://smokey01.com/gjuhasz/packages/teamviewer-11bare.pet>

Works, however, if you have wine 1.7.21 co-installed, e.g., wine\_puli\_wdt-1.7.21.pet - also from <http://www.smokey01.com/gjuhasz/packages/>)

Tested in Puli  
Have fun!

DPosted: Tue 01 Dec 2015, 13:39 Post subject:

- I have both of these in my /mnt/sdb1/packages folder with the necessary settings in the /mnt/sdb1/profiles/Common/smartload file, so they auto-load during Startup. I sent you a PM quoting the "failure to load" warning displayed during Startup. WINE is working OK.
- I started a Pull session, and ran TeamViewer-11, noted my ID & Password [rebooted into Slacko because I didn't have an email client set up in Puli but had Thunderbird set up in Slacko] and sent you my ID & Password from Slacko.
- Discovered that once I rebooted back into Puli, the ID & Password had changed [I need to find out in detail how TeamViewer works], so your attempt to connect to my PC failed. Is it necessary or not to set up a TeamViewer account, and log in at the beginning of a session?
- I had Skype running, was logged in, mic and headphones worked OK, and I could see your text being typed on my screen, but it seemed that you couldn't see the text I was typing in reply. So I need to get some practise [not practice] on Skype also, to learn in detail how it works.
- Which info to post here, and which to send in PM's, or emails?

DPosted: Sun 10 Jan 2016, 14:48 Post subject: powerapplet\_tray merged with xbtalarm

Hi,  
For those cannot get powerapplet\_tray working, I referenced it in xbtalarm. Among other changes, I applied new icons and forced the right one to appear in the tray. Changed the default alarm level to 10%. Tested in Puli, probably works for other puppies, too.

As powerapplet\_tray is a built-in feature in Puli, it is excluded from the attached pet package. The full version is uploaded with my other post, see <http://murga-linux.com/puppy/viewtopic.php?t=100492&start=12>

Have fun!  
Regards,  
gjuhasz

Edit on Jan 28: xbat-p.pet uploaded again after some bugfix

xbat-p.pet

DPosted: Fri 15 Jan 2016, 12:23 Post subject: Vulnerability in the OpenSSH

Hi,  
A new vulnerability in the OpenSSH client was detected yesterday. It affects all versions of the program, from 5.4 to 7.1. The detected bug (CVE-2016-0777) allows an attack leading to a leakage of the private key.

While patches and updates are being rolled out for affected distributions, the feature causing this security issue can be disabled manually in order to resolve the issue. This can be done by adding a line to your SSH configuration. Edit your /etc/ssh/ssh\_config file as follows:

- Find the line that contains Host \* (in the default ssh.config, this is Line 19)
- Just after this line, create a new one with the following content:

```
Code:
UseRoaming no
```

- Save this file.
- Create a new folder on your boot pendrive as /patch/etc/ssh
- Copy your updated /etc/ssh/ssh\_config file to the new folder on the pendrive.
- Unmount the pendrive.

**Warning!** An earlier ssh.config file may be accidentally restored if you edited /etc/ssh/ssh.config some time ago then created a backup file. If you have never touched /etc/ssh.config, then please ignore this warning note.

Note that servers could be also potentially affected in case key-based auth is used to connect to other servers by SSH. See <https://access.redhat.com/articles/2123781>

This patch / the fixed OpenSSH package will be included in the next Pull expected in Feb 2016.

Have fun!  
Regards,  
gjuhasz

Completed steps 1 to 6 in the post immediately above. 😊

Any way to test that it's working?  
Or is this a silly question?

**gjuhasz wrote:**  
Find the line that contains Host \* (in the default ssh.config, this is Line 19)

My ssh\_config file looks like this:

```
Code:
ForwardAgent yes
ForwardX11 yes
```

with no other contents.

There is also an sshd\_config file in the same directory. Am I exposed to this bug? Why don't I have a line 19?

- I am not using Puli I'm on a Slacko 5.6 derivative but thought you might have some insight to offer. cheers!

DPosted: Mon 18 Jan 2016, 14:28 Post subject: OpenSSH

As it is written in the bug description, this vulnerability is related to a non-public feature of the OpenSSH client. 😊

So, there there should be some lines

```
Code:
Host *
UseRoaming no
```

as a mitigation in the ssh.config file regardless of the other content. (I mentioned Line 19 because I referenced the default ssh.config file of Puli 6.0.4.)

Analysis of the fix is available at <http://www.openwall.com/lists/oss-security/2016/01/14/7> ... nice, isn't it?  
More details could be answered by any those had been interested in putting this "feature" into OpenSSH... Be sure, I was not among the requestors. Maybe Mr. E.S. knows some of them. 😊

Have fun!

DPosted: Thu 21 Jan 2016, 13:20 Post subject: Puli defends Linux Kernel Vulnerability (CVE-2016-0728)

Dear Puli users,  
Just FYI...  
the newly discovered Linux kernel vulnerability (CVE-2016-0728) is unable to impact (any version of) Puli operated either in the Crazy or the Lazy security profiles.

Have fun!  
Regards,  
gjuhasz

Hi,  
There are updates for xbtalarm available (bugfixes, new features). See the referenced forum thread for details. Package updated at <http://murga-linux.com/puppy/viewtopic.php?t=96964&start=154>, too

Have fun!

DPosted: Fri 11 Mar 2016, 16:51 Post subject: Netsurf 3.4  
Subject description: Compiled for Puli and other 32-bit puplets

I compiled netsurf 3.4

Download link:  
<http://smokey01.com/gjuhasz/packages/netsurf-3.4.pet>

Runs fine in Puli. Probably works with most of 32-bit puplets, too.

Have fun!  
Regards,  
gjuhasz

**PROBLEM**  
1. Used a 2nd Puppy to copy the Netsurf pet file into the Puli Packages folder, and added a "netsurf" entry in the .../profiles/Common/smartload file. Then rebooted to Puli.

2. During the loadup...  
I could see that netsurf was being loaded ok. But then...

3. A warning was given in red that additional packages were failing to load.

4. Once into Puli there was no sign of Netsurf being available. 😊

Dear Sylvander,  
If you "conventionally" install my netsurf-3.4.pet (by clicking the filename), it works.

However, you are right, smartloading the same netsurf-3.4.pet file fails.

So, I created another pet file in a different way then uploaded it to my storage.  
<http://smokey01.com/gjuhasz/packages/netsurf-3.4.pet>

This version is OK for smartload, too. Tested in Puli.

Thanks for the notification and sorry for the inconvenience.

Have fun!  
Regards,  
gjuhasz
