Thanks for that! 😊 Before I get to it, since puli comes in .zip format (not ISO) will this actually work?

Gonna try it anyway.....want to learn some new stuff 😊

You're gonna go with which, 32 or 64? The most current?

Most current, 64 bit. Just did the whole thing, getting a black screen with some letters for about a 10th of a sec and it shuts down. From what I could see probably a "grub" message.

Will give it another shot.

No hurry 😊 Also still figuring out why and what.

Hey BP, sorry, I'm gonna pass. There's more here than I care to involve myself with.

No worries. Will give it a fresh start tomorrow.

Too bad though, this distro has some promising features. Should be easier to install imho. 😊

I knew (with a little help from my friends) I'd get it. Convoluted 4 shore, but I got it. I don't think I've ever had to jump through the hoops I did with any other Pup install, but, by George, I GOT IT!

I'll add it's NOT for beginners, @ least, not in my opinion.

Tell me, is there anything wrong with Bionic64? Is it not easy enough to use? I don't know.. Maybe you're coming off Windows and still overly paranoid? If you plan on banking and whatnot, just make sure your browser of choice is current.

Besides, you'll get timely support running one of Pups mainstream builds.

Hello Puli.  
I am very interested in this Puppy but I can't seem to get it installed. I have no windows machine so I can't use the tools you point to in your first post.  
I have tried several Linux Image writing tools to no avail (yet).  
I keep getting messages like "no frugal install files found at sdb"x" or "no boot records written to sdb"x" .  
Really want to run this distro but been trying to get it to run for almost 2 days now. Any help would be appreciated. 😊

Hi bullpup,

Maybe this post will help. <http://www.murga-linux.com/puppy/viewtopic.php?p=1042604#1042604>

You may not need to fully follow the instructions. Once you've unzipped the package you can copy/move all the files from the unzipped folder to an uniquely named folder --such as pull-- on sdbx. Then add Puli to your bootloader's grub config or grub4dos menu.lst.

If you are running a different Puppy and sdb is a (a) USB-Key or (b) you don't have a UEFI computer and don't care about overwriting your current bootloader, just run Menu>Setup>Grub4dos. Grub4dos will create a new bootloader which will list and boot almost every operating system. But Grub4dos can't boot UEFI computers. The 'almost' is that I've had it fail to recognize manjaro as an operating system. (My preference is to place grub4dos on a USB-Key even when Puppies are on a hard-drive. Plug in the key: boot puppies. Unplug the key, boot Windows & Other Distros).

If your current bootloader is grub2, ask how to customize it to add Puppies.

There is NOTHING wrong with Bionic. Period. works perfectly. It's my main OS.

I DO come from Windows some 12 years ago and STILL paranoid 😊 Nah, I just love learning new things, trying out 'exotic' distro's and I am very interested in security stuff.

That is why I'd like to try Puli. And learning another way to install a Puppy. Inquiring mind and all that.

@mikesir

Thank you for your instructions and will give it a go later today. Gotta go to work now. 😊

Thanks for pitching in guys.

**gjuhasz**  D Posted: Thu 28 May 2020, 12:41 Post subject: Puli install in Windows environment

**Karambol wrote:**  
I want to try but LinuxLive USB Creator does not see the downloaded archive.  
Also, I am a bit worried about it: <https://www.virusotal.com/gul/file/6ec00c268cc79d375dfca6b9d81247346ff374392c7db65d359482a24c8f0ea/detection>

Dear Karambol,

I propose to download Lili from this folder:

<http://smokey01.com/gjuhasz/Lili/>

It does not contain any virus. You can check the md5 and sha checksums.  
I tested it again using my overprotected Win 10 corporate laptop this afternoon.  
Lili can accept the zip compressed Puli image.

See the first post in this thread (just updated).

Have fun!

Regards,  
gjuhasz

**gjuhasz**  D Posted: Fri 05 Jun 2020, 13:06 Post subject: IrfanView-454

Dear Puli users,

I assembled an IrfanView-454p.sfs package for fun.

Downloadable from this folder:

<https://sourceforge.net/projects/puppysoftver/files/Puli/Puli-64bit/packages/>

You can select EN, DE, HU languages and many plugins.

I tried to minimize the runtime environment,

Tested with Puli 7.3. Probably runs with other puplets, too.

Have fun!

Regards,  
gjuhasz
